BIOCHEMISTRY

Test	Flag	Results	Units	Reference Range	Methodology
HbA1c; GLYCOSYLATED HEMOGLOBIN	H	<u>5.93</u>	%	4.0 - 5.6	TINIA (Turbidimetric Inhibition Immuno Assay)

(SampleType: EDTA WHOLE BLOOD)

INTERPRETATION NOTES :

Interpretation as per American Diabetes Association (ADA) Guidelines	
Reference Group	HbA1c in %
Non diabetic adults >=18 years	4.0 - 5.6
At risk (Prediabetes)	5.7 - 6.4
Diagnosing Diabetes	>= 6.5
Therapeutic goals for glycemic control	< 7.0

Since HbA1c reflects long term fluctuations in the blood glucose concentration, a diabetic patient who is recently under good control may still have a high concentration of HbA1c. Converse is true for a diabetic previously under good control but now poorly controlled.

Target goals of < 7.0 % may be beneficial in patients with short duration of diabetes, long life expectancy and no significant cardiovascular disease. In patients with significant complications of diabetes, limited life expectancy or extensive co-morbid conditions, targeting a goal of < 7.0 % may not be appropriate.

Presence of Hemoglobin variants and/or conditions that affect red cell turnover must be considered, particularly when the HbA1C result does not correlate with the patient's blood glucose levels.

<u>LIPID PROFILE</u>					
(SampleType: Serum)					
TOTAL CHOLESTEROL	H	<u>239</u>	mg/dL	< 200	Enzymatic colorimetric
HDL CHOLESTEROL		50.9	mg/dL	> 40	Homogeneous enzymatic colorimetric
LDL CHOLESTEROL	H	<u>176</u>	mg/dL	< 100	Homogeneous enzymatic colorimetric
VLDL Cholesterol		17	mg/dL	5 - 40	Calculated
TRIGLYCERIDES (TG) - SERUM		83	mg/dL	< 150	Enzymatic colorimetric assay
NON-HDL CHOLESTEROL	H	<u>188</u>	mg/dL	< 130	Calculated
CHOL/HDL Ratio		4.70	Ratio	3.5 - 5	Calculated
LDL/HDL Ratio		3.46	Ratio	Ideal: < 2.0 Good: <5.0 Bad: >5.0	Calculated
TG/HDL Ratio		1.63	Ratio	Ideal: <2.0 Good: 3 - 6 Bad: >=6.0	Calculated

INTERPRETATION NOTES :

Age	Total cholesterol (mg/dL)	Non-HDL cholesterol (mg/dL)	LDL cholesterol (mg/dL)
19 and younger	Desirable: < 170; Borderline high: 170-199; High: 200 or higher	Desirable: <120; Borderline high: 120-144; High: 145 or higher	Optimal: <110; Borderline high: 110-129; High: 130 or higher
20 and older	Desirable: < 200; Borderline high: 200-239; High: 240 or higher	Desirable: <120; High: 130 or higher	Optimal: <100; Near-optimal: 100-129; Borderline high: 130-159; High: 160-189; Very high: 190 or higher

INFECTIOUS SEROLOGY

<u>Test</u>	<u>Flag</u>	<u>Results</u>	<u>Units</u>	<u>Reference Range</u>	<u>Methodology</u>
Anti-HCV Antibody		0.0525(Non Reactive)	COI	< 0.90, Non Reactive	ECLIA

(SampleType: Serum)

INTERPRETATION NOTES :

Result (COI)	Remarks	Interpretation
< 0.90	Non-Reactive	Indicates absence of antibodies to Hepatitis C virus
0.90 - 0.99	Borderline (Equivocal)	Equivocal result requires repeat testing in 10-14 days
>= 1.0	Reactive	Indicates presence of antibodies to Hepatitis C virus

Reactive test result indicates presence of Hepatitis C virus infection. Active infection to be confirmed by HCV RNA PCR test. It cannot differentiate between the stages of Hepatitis C viral infection nor used to monitor the efficacy of treatment.

Low & High Reactive anti-HCV results are recommended to be evaluated by HCV RNA PCR studies.

Non-Reactive test result indicates Hepatitis C virus infection is unlikely.

False positive results may be observed in patients receiving mouse monoclonal antibodies, on heparin therapy, on biotin supplements for diagnosis or therapy or presence of heterophilic antibodies in serum.

False negative reaction may be due to processing of sample collected early in the course of disease, Prozone phenomenon, Immunosuppression & Immuno-incompetence.

Hepatitis B surface antigen (HBsAg)	0.253(Non Reactive)	COI	< 0.90, Non Reactive	ECLIA
--	---------------------	-----	----------------------	-------

(SampleType: Serum)

INTERPRETATION NOTES :

Result (COI)	Remarks	Interpretation
< 0.90	Non-Reactive	Indicates absence of Hepatitis B Surface Antigen.
0.90 - 0.99	Borderline	Borderline result requires repeat testing
>= 1.0	Reactive	Indicates presence of Hepatitis B Surface Antigen.

Reactive test result indicates presence of Hepatitis B Surface Antigen. It cannot differentiate between the stages of Hepatitis B viral infection.

Non-Reactive test result indicates absence of Hepatitis B Surface Antigen.

False negative reaction may be due to processing of sample collected early in the course of disease or presence of mutant forms of HBsAg.

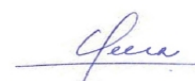

For monitoring HBsAg levels, Quantitative HBsAg assay is recommended.

INFECTIOUS SEROLOGY

<u>Test</u>	<u>Flag</u>	<u>Results</u>	<u>Units</u>	<u>Reference Range</u>	<u>Methodology</u>
HIV (1 & 2) Antibodies + P24 Antigen		0.241 (Non Reactive)	COI	< 1.00, Non-reactive	ECLIA

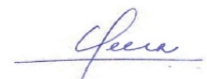

(SampleType: Serum)

INTERPRETATION NOTES :

Result (COI)	Remarks	Interpretation
< 1.0	Non-Reactive	Indicates Negative for HIV-1 Ag and negative for anti-HIV-1/2 antibodies.
>= 1.0	Reactive	Indicates positive for HIV-1 Ag/ anti-HIV-1/2 antibodies. Reactive samples must be confirmed by Western Blot and HIV RNA tests.
